Dicount Cards

java edu/shapkofil/Main command in */out/production/DiscountCards directory will run the programme.*

Starting the programme ask the user for a the his/her name and then takes him/her to the main menu in it's TUI. The user has 4 options to choose from:

1. Change card
   Allowes the user to choose one of the three cards. The cards store the discount calculation method and owners name.

2. Enter purchase data
   Lets the user type in the turnover for the lat mouth and the current purchase cost

3. Get purchase details
   Outputs the wanted information about the discount rate, the discount and the total cost of the purchase.

4. Exit (self-explanatory)

For the actual build I've provided an architecture uml diagram both in the repo's markdown file and the main directory of this piece of software.
